

Address Update Web Application

Project Title	Address Update Web Application
Project Summary	Write a web-based user interface to maintain a list of addresses.
Country	United States

Project Description

Help the Census Bureau maintain a list of addresses!

The goal of the minimum content guidance is to include only the information needed to identify an address/location as well as some basic identifying/metadata information about the address/location. The objective is to provide sufficient information for Field Representatives (FRs) to identify an address or location that may require caution. The intent of the application is to capture locations where there are significant activities that can potentially impact or delay field work. These activities can range from road closures, natural hazards, or unique address specific situations etc., so FR's can avoid visiting households in that vicinity. The minimum content we intend to capture includes

- ? Address Number (House Number)
- ? Street Name
- ? Subaddress (such as a Within Unit Designator, as a Suite or Apartment number)
- ? City/Town/Place
- ? County
- ? State
- ? Zip

Metadata about the location

- Street intersection
- Highway mile pointer
- Known

Required Skills or Interests

Skill(s)

Software development

Website design
